**WARNING:**

- The Canadian Electrical Code and National Electric Code requires ground fault protection of equipment for each branch circuit supplying electrical heating cables or devices.
- The contents of the component kit must be installed correctly to ensure proper operation and to prevent shock and fire. Read these important warnings and carefully follow all the installation instructions.
- Overheating heat-shrink tubes will produce fumes that may cause irritation. Use adequate ventilation and avoid charring or burning.
- To minimize the danger of fire from sustained electrical arcing if the heating cable is damaged or improperly installed, use a ground fault protection device. Arcing may not be stopped by conventional circuit breakers.
- Component approvals and performance are based on the use of specified parts only. Do not substitute parts or use vinyl electrical tape.
- The black heating-cable core is conductive and can short. It must be properly insulated and kept dry.
- Damaged bus wires can overheat or short. Do not break bus wire strands when preparing the cable for installation.
- Bus wires will short if they contact each other. Keep bus wires separated.
- Heat-damaged components can short. Use a heat gun or torch with a soft yellow heat flame; not a blue focused flame. Keep the flame moving to avoid overheating, blistering, or charring the heat-shrink tubes. Avoid heating the other components. Replace any damaged parts.
- Leave these installation instructions with the user for future reference.

**Installation Instructions**

**Kit Description**

The Dekoron® HTP 1548-40RGP power connection kit for roof and gutters distributed by Heat-Line includes materials for one power connection and one end seal termination.

For use with Dekoron 2705-1RG (-2RG) as CSA type 2E for roof and gutter de-icing.

For use with Dekoron 2705-11T (-21T) as UL Listed snow melting and de-icing equipment.

**Tools Required**

- Ruler or tape measure
- Flat blade screw driver
- Utility knife
- Diagonal cutters
- Needle-nose pliers
- Heat gun or propane torch

**Additional Materials Required (but not provided)**

- Appropriate junction box

**Approvals**

- De-Icing and Snow Melting Equipment when used with associated kits and installed per manufacturer’s instructions.
- Certified Roof De-Icing when used with associated kits and installed per manufacturer’s instructions.

Heater with Ground Braid and Outer Jacket

1. Slide compression ring, grommet ring, and grommet onto the heating cable approximately 8 to 10 inches.

2. Strip outer jacket 6-1/2 inches from the end.

3. Make an opening in the ground braid, bend the heater, and pull the inner jacket and core through the opening in the ground braid.

4. Strip inner jacket as shown.
   • Leave 1/2 inch inner jacket covering core.
   • Twist the ground braid into a pigtail. Trim pigtail to remove tapered end.
5. Notch the center core between the bus wires and pull the bus wires away from the core for 6 inches.

6. Do Not Cut or Damage Bus Wires

• Remove the center core material and any core material on the bus wires.
• Re-twist bus wires.

7. Install heat-shrink tubes over bus wires.
• Heat shrink the tubes into position, keeping the heat source moving from side to side.

8. Install green heat-shrink tube over the ground braid and heat shrink into position.

9. Install black 1/2 inch x 1-1/2 inch heat-shrink tube as shown.

10. While tube is still hot, pinch with pliers between bus wires to seal; hold for 10 to 15 seconds.

**WARNING:** Do not expose heating cable outer or inner jacket to excessive heat.
11. Slide sealing fitting components to position at the core sealer.

12. Insert sealing fitting into junction box (Junction box not included).

13. Insert heating cable through sealing fitting and tighten components into place.

14. Connect heating cable leads to power wire leads (ground braid pigtail to ground wire).

15. Install weather tight cover.
End Seal Installation Instructions

1. Strip outer jacket 1 inch from the end.

2. Unravel ground braid and trim at outer jacket.

3. Place the black 1-1/2 inch heat shrink tube over the end of the exposed inner jacket leaving 3/8 of an inch overhang beyond tip of heating cable.
   - Shrink tube in place.

   WARNING: Do not expose heating cable outer jacket to excessive heat.

4. Using needle-nose pliers, squeeze end and hold for 10 to 15 seconds. A tight seal is required to stop moisture migration into the heating cable conductive core.

5. Place the black 4 inch heat shrink tube over the end of the heating cable leaving 3/8 of an inch overhang over the smaller heat shrink tube.
   - Shrink tube in place.

   WARNING: Do not expose heating cable outer jacket to excessive heat.

6. Using needle-nose pliers, squeeze end and hold for 10 to 15 seconds in order to create a tight seal.
